

Jennifer Pfeiffer

Jennifer grew up in Montreal and attended McGill University for her Bachelor's degree in Sociology and Chemistry after a two-year gap studying in the Middle East. She held an internship at Merck Frosst and then moved to Ottawa to pursue her Master's degree in Organic Chemistry under the supervision of Dr. André Beauchemin.

One of her projects involved the novel synthesis of a dart frog poison. Jennifer worked briefly in Toronto in a synthesis company but returned to Ottawa to join the public service and her then-fiancé, now-husband.

She started at Environment Canada in chemical regulations and came to Health Canada as a chemistry evaluator eight years ago. Her work predominantly involves the pre-market review of generic immediate-release tablets.

As she would feel disloyal to her hometown ever cheering for the Sens, Jennifer often attends 67s games with her two young daughters. She enjoys downhill skiing and skating but would prefer having summer all year along.
